**General Description**

The TYCO DV-5a Automatic Water Control Valves are diaphragm type valves that can be used in double interlock preaction fire protection systems. When properly trimmed, the double seat design of the DV-5a Valve also provides actuation of fire alarms upon system operation.

The diaphragm style design of the DV-5a Valve allows external resetting, providing for easy resetting of a deluge system without having to open a valve handhole cover to manually reposition a clapper and/or latch mechanism. Simply re-pressurizing the diaphragm chamber resets the valve.

The DV-5a features internal and external coating of the valve to provide corrosion resistance. The external corrosion resistance of the epoxy coating permits the use of the DV-5a in corrosive atmospheres associated with many types of industrial processing plants and outdoor installations.

The DV-5a Valves are offered with the DV-5a Valve and separately ordered semi-assembled trim shown in Figures 6 and 7, or, for ease of installation, with DV-5a Valve completely trimmed with or without a System Main Control Valve.

Double interlock preaction systems are designed for use in applications, such as refrigerated areas, requiring the maximum degree of protection against inadvertent flooding of the sprinkler system piping. In order for a double interlock preaction system to automatically activate, two independent events must occur. First, the electric detection system must operate, and secondly, an automatic sprinkler on the system piping must operate. Typically, the electric detection system is designed to operate before any automatic sprinkler. Operation of just the electric detection, or just the opening of a sprinkler will not allow the DV-5a Valve to open and permit water to flow into the normally dry sprinkler system piping. However, operation of just the electric detection system or the opening of a sprinkler (loss of system air pressure) will result in a supervisory alarm to notify the building occupants of a condition needing attention so as to avoid inadvertent flooding of the system piping.

A solenoid valve is used in the Electric/Electric Actuation to hold the DV-5a Valve closed by locking pressure in the diaphragm chamber of the DV-5a Valve. In the event of a fire, Zone 1 of a releasing panel is initiated by a fire detection or electric manual pull station, and Zone 2 of the releasing panel is initiated by a low pressure alarm switch triggered by loss of system air pressure due to the opening of an automatic sprinkler. Initiating of Zone 1 and 2 results in opening the solenoid valve to operate the DV-5a Valve.

The selection of Electric/Electric versus Electric/Electric is related to desired system air pressure and system volume that affects water delivery time restraints.

**NOTICE**

The DV-5 Valves described herein must be installed and maintained in compliance with this document, as well as with the applicable standards of the NATIONAL FIRE PROTECTION ASSOCIATION (NFPA), in addition to the standards of any other authorities having jurisdiction. Failure to do so may impair the performance of these devices.

The owner is responsible for maintaining their fire protection system and devices in proper operating condition. Contact the installing contractor or product manufacturer with any questions.

**Technical Data**

**Approvals**
- UL/C-UL Listed
- FM Approved

Listings and Approvals are based on DV-5 being trimmed as described in this technical data sheet.

**DV-5 Valve**

Components for the 1 1/2 thru 8 in. (DN40 thru DN200) DV-5 Valves are shown in Figure 1. The DV-5 Valves are for vertical installations. They are rated for use at a service pressures of 20 to 300 psi (1.4 to 20.7 bar).

The take-out dimensions are shown in Figure 3, and flanged connections are available drilled per ANSI, ISO, AS, and JIS specifications (See Table A). Threaded inlet and outlet connections are available in NPT or ISO 7-1. Threaded port connections are NPT threaded.

**NOTE:** PN16 flanges are pressure rated to 16 bar.

**Valve Trim**

The maximum pressure rating for the Electric/Electric Double Interlock Preaction Trim is dependent on separately ordered solenoid valve per Technical Data Sheet TFP2180.

Electric/Electric Double Interlock Preaction Trim, when using the separately ordered QRS Electronic Accelerator, is based on the separately ordered QRS Electronic Accelerator per Technical Data Sheet TFP1100.

When the system pressure is greater than 175 psi (12.1 bar), provision is to be made to replace the standard order 300 psi (20.7 bar) Water Pressure Gauges with separately ordered 600 psi (41.4 bar) Water Pressure Gauges.

If the addition of an Alarm Control Valve is desired or required by the local AHJ, the Alarm Control Valve noted as Item H in Figure 8 is to be a separately ordered electronically supervised normally open valve.

External trim connections are NPT threaded. EMEA trim is provided with NPT x ISO 7-1 thread adapters.

**Pressure Loss**

See Graph A

**Actuation Options**

See Electric/Electric Actuation subsection for additional information.

**Materials of Construction**

**Valve Body**
- Epoxy coated ductile iron per ASTM A536-77, Grade 65-45-12

**Diaphragm Cover**
- Epoxy coated ductile iron per ASTM A536-77, Grade 65-45-12

**Diaphragm**
- Polyester fabric reinforced, Teflon coated, EPDM rubber per ASTM D2000

**Diaphragm Cover Fasteners**
- Aluminum zinc coated steel

**Common Hardware Trim**
- Common hardware pipe fittings are galvanized or black as required and are malleable per ASME B16.3.
- Common hardware pipe nipples are galvanized or black as required and are Schedule 40 per ASTM A53 or A135.
- Common hardware compression fitting are brass per ASTM B16
- Common hardware tubing is Type L per ASTM B88
**Operation**

The TYCO DV-5a Valve is a diaphragm style valve that depends upon water pressure in the Diaphragm Chamber (see Figure 2A) to hold the Diaphragm closed against the water supply pressure.

When the DV-5a Valve is set for service, the Diaphragm Chamber is pressurized through the trim connections from the inlet side of the system's main control valve.

Opening of a solenoid valve for Electric/Electric Actuation (see Figure 4) trips the Model MRA-1 Manual Reset Actuator. Tripping the MRA-1 releases water from the DV-5a Diaphragm Chamber faster than it can be replenished through the 1/8 in. (3.2 mm) restriction located in the diaphragm chamber supply connection. Release of water through the MRA-1 results in a rapid pressure drop in the DV-5a Diaphragm Chamber. The force differential applied through the Diaphragm to hold the Diaphragm in the set position is then reduced below the valve trip point. The water supply pressure then forces the Diaphragm open permitting water to flow into the system piping, as well as through the Alarm Port to actuate the system alarms (see Figure 2B).

Upon opening of the DV-5a Valve, the Model MRA-1 Manual Reset Actuator opens to constantly vent the DV-5a Diaphragm Chamber to "hydraulically latch" the DV-5a in the tripped position until manually reset.

See Electric/Electric Actuation subsection for additional information.
**Electric/Electric Actuation**

**System Design Considerations**

Because a double interlock preaction system requires time for a drop in system air pressure to occur (concurrently with the response time for the separate fire detection system) before it will allow water to enter the system piping, this system has characteristics similar to a dry pipe sprinkler system. Therefore, the system design considerations for a dry pipe system are normally applied to a double interlock preaction system, including: a 30% increase in design area; a maximum 1 minute water delivery time for system capacities of 500 gallons (1890 liters) or more; and, prohibition of gridded system piping.

As an option, the DV-5a Double Interlock Preaction System with Electric/Electric Actuation may be equipped with the Model QRS Electronic Accelerator to reduce the time to valve actuation following the operation of the electric detection system and one or more automatic sprinklers. Refer to Technical Data Sheet TFP1100 for details regarding installation requirements and pressure ratings.

**Note:** Use of the Model QRS Electronic Accelerator can permit system volumes of 750 gallons (2840 Liters) without applying the minimum one minute water delivery time.

In order to readily perform the System Inspection Procedure described in the Care and Maintenance section, it is recommended that a System Shut-Off Valve be installed above the DV-5a Valve, as shown in Figure 4. The System Shut-Off Valve should be a listed or approved (as appropriate) indicating valve with a supervisory switch to monitor the normally open position.

**Detection System**

The Double Interlock Preaction System With Electric/Electric Actuation Trim provides for electric operation of the DV-5a Valve by a detection system consisting of electrical devices such as heat sensitive thermostats, smoke detectors, and/or electric manual pull stations. Information on the various types of separately ordered Solenoid Valves that may be used with this trim package is given in Technical Data Sheet TFP2180. Nominal installation dimensions for the Double Interlock Preaction System With Electric/Electric Actuation Trim are shown in Figure 7.

The cross-zone deluge valve releasing panel (automatic control unit) with battery back-up, fire detection devices, manual pull stations, and signaling devices, that are utilized with the Double Interlock Preaction System with Electric/Electric Actuation must be UL Listed, ULC Listed, C-UL Listed, or FM Approved, as applicable.

**NOTES:**

The normally closed, de-energized solenoid Valve is separately ordered and selected based on the required laboratory approval acceptable to the authority having jurisdiction. Refer to technical data Sheet TFP2180 for specific laboratory approvals.

Consult with the authority having jurisdiction regarding installation criteria pertaining to electric actuation circuitry.

Due to the functionality of the Model MRA-1 Manual Reset Actuator, the release circuit of the releasing panel need only provide the typical ten minutes of alarm condition intended to energize the Solenoid Valve to
open. After the ten minute duration, at which point should the Solenoid Valve become de-energized and close (especially while operating under battery back-up), the MRA-1 will have already automatically opened, thereby preventing the DV-5a Diaphragm Chamber from becoming re-pressurized, and preventing an inadvertent closing of the DV-5a during a fire event.

WARNING
If the delay between electric actuation and subsequent sprinkler activation is anticipated to be greater than 10 minutes, adjust the battery back-up calculation accordingly. Inadequate battery back-up may result in failure of the system to operate in the event of a fire during a power failure.

Releasing Circuit
The releasing circuit must be equipped with a Potter RCDS-1 Releasing Circuit Switch, or equivalent. The RCDS-1 provides for a temporary disconnect (de-energized) of the Solenoid Valve during Step 9 of the Valve Resetting Procedure.

System Air Pressure Requirements
The recommended system air pressure for the Double Interlock Preaction System with Electric/Electric Actuation is nominally 15 psi (1,0 bar), irrespective of the water supply pressure. The use of a higher system air pressure may or may not adversely affect water delivery time, and the use of a lower system air pressure may prevent clearing the alarm of the Low Pressure Switch on increasing pressure. The Low Pressure Switch is field set to alarm at nominally 12 psi (0,8 bar) on decreasing pressure when using a nominal system air pressure of 15 psi (1,0 bar). It is recommended that the system air pressure be maintained by either of the following methods:

- A maximum 200 psi (13,8 bar) plant air supply in combination with the Model AMD-1 Air Maintenance Device described in Technical Data Sheet TFP1221
- A maximum 3000 psi (206,9 bar) nitrogen cylinder in combination with the Model AMD-3 Nitrogen Maintenance Device described in Technical Data Sheet TFP1241

NOTES:
It is recommended that the pressure maintenance device be of a type that maintains a constant system pressure, i.e., a pressure maintenance device that utilizes a pressure regulator versus a pressure switch (e.g., the AMD-1 or AMD-3). Use of a pressure switch operated pressure maintenance device with a cut-in/cut-out differential may result in a delay in the operation of the system due to a fire, because of the cut-out pressure being higher than the recommended nominal system air pressure.

An air dryer must be installed where the moisture content of the air supply is not properly controlled at less than the required value.

It is recommended that an AMD-3 Nitrogen Maintenance Device be utilized in dry pilot actuation system applications where the dew point must be maintained below -20°F (-29°C). Refer to Technical Data Sheet TFP1241.

The dew point of the pilot line air pressure must be maintained below the lowest ambient temperature to which the dry pilot actuation system will be exposed. Accumulation of water in the pilot line connection to the Actuator will lower the air pressure at which the actuator will open and possibly prevent proper operation. Also, introduction of moisture into the pilot lines exposed to freezing temperatures can create an ice build up which could prevent proper operation of the Actuator.

The Air Pressure Relief Valve is typically field set to crack open at a pressure of about 20 psi (1,4 bar) when using a nominal system air pressure of 15 psi (1,0 bar).

The dew point of the air or nitrogen supply, for a system exposed to freezing conditions, must be maintained below the lowest ambient temperature to which the system piping will be exposed. Introduction of moisture into the system piping can create ice build up which could prevent proper operation of the system.

The Air Pressure Relief Valve is typically field set to crack open at a pressure of about 20 psi (1,4 bar) when using a nominal system air pressure of 15 psi (1,0 bar).

Notes:
The dew point of the pilot line air pressure must be maintained below the lowest ambient temperature to which the dry pilot actuation system will be exposed. Accumulation of water in the pilot line connection to the Actuator will lower the air pressure at which the actuator will open and possibly prevent proper operation. Also, introduction of moisture into the pilot lines exposed to freezing temperatures can create an ice build up which could prevent proper operation of the Actuator.

The Air Pressure Relief Valve is typically field set to crack open at a pressure of about 20 psi (1,4 bar) when using a nominal system air pressure of 15 psi (1,0 bar).

**GRAPH B**

**DV-5a VALVE DOUBLE INTERLOCK PREACTION SYSTEM AIR PRESSURE REQUIREMENTS**
Installation

The TYCO DV-5A Valve is to be installed in accordance with this section.

**NOTICE**

**DV-5A Automatic Water Control Valves** are designed to be used in freshwater systems. When the supply is from an alternative source such as brackish water, saltwater, or contains additives such as foam, the limited warranty is reduced to one year from the time of installation. An increase in frequency of inspections is required when the valve is exposed to such supplies and other corrosive conditions or chemicals that could impact valve materials or the operation of the assembly. The system and all components must be designed accordingly for the increased demand. It is required to thoroughly flush the valve and trim assembly with freshwater and reset to the set condition after each operation.

Proper operation of the DV-5A Valves depends upon their trim being installed in accordance with the instructions given in this technical data sheet. Failure to follow the appropriate trim diagram may prevent the DV-5A Valve from functioning properly, as well as void approvals and the manufacturer’s warranties.

The DV-5A Valve must be installed in a readily visible and accessible location.

The DV-5A Valve and associated trim must be maintained at a minimum temperature of 40°F (4°C).

Heat tracing of the DV-5A Valve or its associated trim is not permitted. Heat tracing can result in the formation of hardened mineral deposits that are capable of preventing proper operation.

Always open the system control valves slowly to avoid a sudden rush of water entering the system.

The DV-5A Valve is to be installed in accordance with the following criteria:

**Step 1.** All nipples, fittings, and devices must be clean and free of scale and burrs before installation. Use pipe thread sealant sparingly on male pipe threads only.

**Step 2.** The DV-5A Valve must be trimmed in accordance with one of the trim illustrations shown in Figure 5.

**Note:** If the addition of an Alarm Control Valve is desired or required by the local AHJ, the Alarm Control Valve noted as Item H in Figure 8 is to be a separately ordered electronically supervised normally open valve.

**Step 3.** Care must be taken to ensure that check valves, strainers, globe valves, etc., are installed with the flow arrows in the proper direction.

**Step 4.** Drain tubing to the Drip Funnel must be installed with smooth bends that will not restrict flow.

**Step 5.** The Main Drain and Drip Funnel Drain may be interconnected provided a check valve is located at least 12 in. (300 mm) below the Drip Funnel.

**Step 6.** Suitable provision must be made for disposal of drain water. Drainage water must be directed such that it will not cause accidental damage to property or danger to persons.

**Step 7.** Connect the Diaphragm Supply Valve to the inlet side of the System Main Control Valve in order to facilitate setting of the DV-5A Valve (see Figure 8).

**Step 8.** An Inspector’s Test Connection is to be located on the sprinkler system at the most hydraulically demanding location.

**Step 9.** A suitable automatic air (nitrogen) supply, as described in the applicable Electric/Electric Actuation sub-section, is to be installed in accordance with the applicable technical data sheet. The minimum air pressure is to be in accordance with the referenced sub-sections.

**Step 10.** A desiccant dryer, when specified, is to be installed between a drip leg and the Air Maintenance Device.

**Step 11.** The Low Pressure Switch on falling pressure in the Electric/Electric Actuation is to be adjusted so that the low pressure alarm setting is set at 3 psi (0.21 bar) below the system air pressure.

**Step 12.** Unused Pressure Alarm Switch connections must be plugged.

**Step 13.** The Pressure Relief Valve on rising pressure is to be at 5 psi (0.34 bar) higher than the required system air pressure, or be reset in accordance with the requirements of the authority having jurisdiction.

To reset the Pressure Relief Valve, first loosen the jam nut and then adjust the cap accordingly, clockwise for a higher pressure setting or counter-clockwise for a lower pressure setting. After verifying the desired pressure setting, tighten the jam nut.

**Step 14.** Conduit and electrical connections are to be made in accordance with the applicable standards of the approval agency.

**Step 15.** Before a system hydrostatic test is performed, the DV-5A Diaphragm Chamber is to be depressurized, the Automatic Drain Valve is to be temporarily replaced with a plug, and the Diaphragm Cover Bolts must be uniformly and securely tightened using a cross-draw sequence. After tightening, double-check to make certain that all of the Diaphragm Cover Bolts are securely tightened. See Table B in the Care and Maintenance section for torque specifications.
Notes:
1. Port Connections P1 through P7 are described in Figure 2.
2. External Trim Connections C1 through C5 are described in Figure 8.
3. When ordering pre-assembled “DV-5a Valve with Galvanized Trim and Butterfly Valve”, Items A1 through A10 are provided, as applicably related to valve size, and Item A7 is provided as P/N 52-287-1-124 described in Technical Data Sheet TFP2180.
4. When ordering DV-5a Trim separately from the DV-5a Valve, Items A1 through A10 are separately ordered, as applicably related to valve size. Water Pressure Gauges for EMEA valve trim are also separately ordered.

Notes:
1. Dimensions based on drain valves being open.
2. Dimensions do not provide installation clearance.
**Valve Setting Procedure**

Perform Steps 1 through 20 when initially setting the TYCO DV-5A Valve, after an operational test of the fire protection system, or after system operation due to a fire. See Figure 8.

**Step 1.** Close the System Main Control Valve (B).

**Step 2.** Close the Diaphragm Supply Valve (P) and Air Supply Valve (R).

**Step 3.** Open the Main Drain Valve (D), System Drain Valve (E), and all auxiliary drains in the system. Close the auxiliary drain valves and the System Drain Valve (E) after water ceases to discharge. Leave the Main Drain Valve (D) open.

At this time make certain that the Pressure Gauge Valves and the Alarm Control Valve (H), as applicable, are open.

**NOTICE**

*Do not open the Inspector's Test Connection and auxiliary drains if resetting after a system test; otherwise, system air pressure will be relieved unnecessarily.*

**Step 4.** Depress the plunger of the Automatic Drain Valve (F) to verify that it is open.

**Step 5.** Clean the Diaphragm Supply Strainer (Q) by removing the clean-out plug and strainer basket. The Diaphragm Supply Strainer (Q) may be flushed out by momentarily opening the Diaphragm Supply Valve (P).

**Step 6.** Inspect for and clear all ice plugs where system piping has been exposed to freezing conditions and when there has been a flow of water into the system.

**Step 7.** Replace all damaged or operated sprinklers. Replacement sprinklers must be of the same type and temperature rating as those that operated.

**NOTICE**

*In order to prevent the possibility of a subsequent operation of an overheated solder type sprinkler, any solder type sprinklers possibly exposed to a temperature greater than their maximum rated ambient must also be replaced.*

**Step 8.** Service the air dryer, if applicable, in accordance with the manufacturer’s instructions.

**Step 9.** De-energize the Solenoid Valve (V) via the Potter RCDS-1 Releasing Circuit Disable Switch, or equivalent.

**Step 10.** Operate (open) the Manual Control Station (M) and then open the Diaphragm Supply Valve (P). After un aerated water ceases to discharge from the Manual Control Station (M) drain tube, slowly close the operating lever by pushing it up. Do not close the hinged cover at this time.

**Step 11.** After allowing water to flow out of the Manual Reset Actuator (N) drain tube until aerated water ceases to discharge, reset the Manual Reset Actuator (N) by pressing the Reset Knob and hold until water stops flowing from its drain tube and the pressure builds and reaches approximately 15 psi (1,0 bar) on the Diaphragm Gauge (K). Pressure will then build up in the DV-5A Diaphragm Chamber.

**Step 12.** Inspect the actuation device drain connections. Any leaks must be corrected before proceeding to the next step. Electric/Electric Actuation drain connection to be inspected are from the Manual Control Station (M) and Solenoid Valve (V) shown in Figure 4.

**Step 13.** Verify the ability for the DV-5A Diaphragm to hold pressure as follows:
- With the diaphragm chamber pressurized per Step 11, temporarily close the Diaphragm Supply Valve (P), and then observe the Diaphragm Gauge (K) for a drop in pressure.
- If a drop in pressure is noted, the DV-5A Diaphragm is to be replaced and/or any leaks must be corrected before proceeding to the next step.
- If the Diaphragm Gauge (K) indicates no drop in pressure, re-open the Diaphragm Supply Valve (P) and proceed to the next step.

**Step 14.** Open the Air Supply Valve (S) and allow the system to automatically re-establish its nominal system air pressure. Observe the Automatic Drain Valve (F) for leaks. If there are leaks, determine/correct the cause of the leakage problem.
- Nominal system air pressure for Electric/Electric Actuation is typically 15 psi (1,0 bar).

**Step 15.** Open the System Shut-Off Valve (X), as will be the case when resetting a system after performing an operational test.

**Step 16.** Reset the electric detection system in accordance with the manufacturer’s instructions. After setting the releasing panel, return the Potter RCDS-1 to “green light - releasing circuit system normal”.

**Step 17.** Partially open the System Main Control Valve (B). Slowly close the Main Drain Valve (D) as soon as water discharges from the Main Drain Valve (D). Observe the Automatic Drain Valve (F) for leaks. If there are leaks, determine/correct the cause of the leakage problem before proceeding.

**NOTICE**

*When the System Main Control Valve (B) is partially opened, the pressure on the DV-5A Diaphragm Chamber may increase. This increase in pressure is normal, and if the pressure is greater than 300 psi (20,7 bar), the pressure is to be relieved by partially and temporarily opening the Manual Control Station (M); however, do not allow the pressure as indicated on the Diaphragm Gauge (K) to drop below the supply pressure shown on the Water Supply Gauge (J), since this action may result in tripping of the DV-5A Valve.*

**Step 18.** Close the hinged cover on the Manual Control Station (M) and insert a new break rod in the small hole through the top of the enclosing box.

**Step 19.** Fully open the System Main Control Valve (B).

**Step 20.** After setting a fire protection system, notify the proper authorities and advise those responsible for monitoring proprietary and/or central station alarms.
Port Connections P1 through P7 are described in Figure 2.

**FIGURE 8**
DV-5a VALVE - DOUBLE INTERLOCK PREACTION ELECTRIC/ELECTRIC ACTUATION
(See Figure 6 for specific Bills of Materials)
Care and Maintenance

The following procedures and inspections must be performed as indicated, in addition to any specific requirements of the NFPA and any applicable standards recognized by the Approval agency. Any impairment must be immediately corrected. See Figure 8.

NOTICE

If the water supply needs to be shut off to the DV-5A valve and trim and cannot be shut off upstream of the system, close the System Main Control Valve (B), the Diaphragm Supply Valve (P), and the Water Supply Shut-Off Valve (R). This will allow any trim above the System Main Control Valve (B) to be taken apart for service if necessary.

The frequency at which the following procedures and inspections are to be performed are to be in accordance with the NFPA and any applicable specific requirements of the standards recognized by the Approval agency.

Before closing a fire protection system main control valve for maintenance work on the fire protection system that it controls, permission to shut down the affected fire protection systems must first be obtained from the proper authorities and all personnel who may be affected by this action must be notified.

The owner is responsible for the inspection, testing, and maintenance of their fire protection system and devices in compliance with this document, as well as with the NFPA and any applicable standards recognized by the Approval agency. Contact the installing contractor or product manufacturer with any questions.

Some procedures in this section result in the operation of the associated alarms. Notify the owner and the fire department, central station, or other signal station to which the alarms are connected before performing the tests.

It is recommended that automatic sprinkler systems be inspected, tested, and maintained by a qualified Inspection Service in accordance with the NFPA and any applicable standards recognized by the Approval agency.

It is recommended that the System Inspection Procedure be performed at least semi-annually by a qualified Inspection Service. The Double Interlock Preaction System Inspection Procedure may be followed in lieu of performing any of the operational tests recommended in the Technical Data Sheets for the 24 VDC Solenoid Valve and Model MC-1 Manual Control Station.

It is recommended that the individuals responsible for the care and maintenance of the Double Interlock Preaction System develop a working understanding of the system, in general, prior to performing inspection and/or maintenance procedures. These instructions, as well as individual instructions for the solenoid valve, dry pilot actuator, manual control station, switches, and pressure maintenance device should be reviewed.

The following procedures pertain to the automatic control valve portion of the Double Interlock Preaction System. Refer to the manufacturer’s instructions and NFPA 25 for care and maintenance procedures for all other devices (e.g., electric detection, main control and system shut-off valves, supervisory devices, sprinklers, etc.).

Before performing the System Inspection Procedure or Waterflow Alarm Test Procedure, which will result in operation of alarms, notify the proper authorities and all personnel who may be affected.

Drop in Water Supply Pressure Below Normal Range

NOTICE

If the water supply pressure is significantly reduced below the normally expected static pressure range (as could occur in the case of a water main break or repair), and there is a subsequent drop in the diaphragm chamber water pressure below its normal range (for example, due to a leak in a piping connection to or from the diaphragm chamber or, a leak in the diaphragm chamber check valve caused by dirt or debris in the check valve seal area), a deluge valve such as the DV-5A could inadvertently trip, if its water supply pressure is quickly restored.

A drop in the water supply pressure to below its normal range (as in the case of an interrupted water supply condition) constitutes an emergency impairment.

Should this condition occur, immediately close the System Main Control Valve (B) and use the following procedure to reset the system:

Step 1. Prior to the water supply pressure being restored to the closed System Main Control Valve (B), note the pressure indicated by the Diaphragm Gauge (K) and determine if the pressure is within the normally expected range.

Step 2. If the diaphragm chamber pressure is below the normal range, check for and correct any source of leakage from the diaphragm chamber prior to resetting the system.

Step 3. After the water supply pressure is restored to the System Main Control Valve (B), reset the DV-5A Valve in accordance with the Valve Setting Procedure section.

NOTICE

For fire protection systems subject to an emergency impairment caused by an interrupted water supply condition, it is recommended that consideration be given to installing a low water supply pressure switch with the appropriate alarm/indications to monitor the water supply pressure.

Waterflow Alarm Test Procedure

To test the waterflow alarm, open the Alarm Test Valve (G), which will allow a flow of water to the Waterflow Pressure Switch (C) and/or Water Motor Alarm. Upon satisfactory completion of the test, close the Alarm Test Valve (G).

To ensure drainage of the alarm line, depress the plunger on the Automatic Drain Valve (F).
**System Operation Procedure**

Proper operation of the DV-5A Valve for both opening of the DV-5A Valve in a fire condition, or not opening the DV-5A Valve in a non-fire condition, must be verified as follows:

**Step 1.** Close the System Main Control Valve (B) and then open the Main Drain Valve (D).

**Step 2.** Manually operate Zone 1 of the Releasing Panel, and verify the following:

- The operation of the Releasing Panel and its associated alarms
- That there is no leakage from the Solenoid Valve (V)

**NOTE:** During this procedure, the Solenoid Valve (V) should remain closed and the DV-5A Valve Diaphragm Chamber should remain pressurized.

This procedure is used to verify that the DV-5A Valve will remain set if the Low Air Pressure Alarm Switch (U) (Zone 2) operates due to loss of system air pressure and the electric detection system (Zone 1) remains in a normal condition.

**Step 4.** Open the Inspector’s Test Connection to relieve system air pressure, and verify the following:

- That the Low Air Pressure Alarm Switch (U) and Zone 2 of the Releasing Panel, as well as its associated alarms, operate properly. The Low Air Pressure Alarm Switch (U) should operate at the previously established pressure (see Installation section, Step 9).
- That there is no leakage from the Solenoid Valve (V).

**Step 5.** Close the Inspector’s Test Connection.

**NOTE:** During this procedure, the Solenoid Valve (V) should remain closed and the DV-5A Valve Diaphragm Chamber should remain pressurized.

This procedure is used to verify that the DV-5A Valve will remain set if the Low Air Pressure Alarm Switch (U) (Zone 2) operates due to loss of system air pressure and the electric detection system (Zone 1) remains in a normal condition.

**Step 6.** Restore the electric fire detection system to a normal condition in accordance with the manufacturer’s instructions after the system air pressure has automatically been restored to normal.

**Step 7.** Close the System Shut-Off Valve (W) after the system air pressure has been restored to normal.

**Step 8.** Open the System Main Control Valve (B) one turn beyond the position at which water just begins to flow from the Main Drain Valve (D).

**Step 9.** Close the Main Drain Valve (D).

**Step 10.** Close the Air Supply Valve (S).

**Step 11.** Manually operate Zone 1 of the Releasing Panel, and then operate Zone 2 of the Releasing Panel by partially opening the System Drain Valve (E) to relieve air pressure at the Low Air Pressure Alarm Switch (U), and verify the following:

- That the DV-5A Valve operates as is indicated by a discharge of water from the System Drain Valve (E) and the Automatic Drain Valve (F). The Automatic Drain Valve (F) may or may not close depending on the flow past the partially open System Main Control Valve (B)
- That the Manual Reset Actuator (N) has operated as is indicated by water discharging into the Drip Funnel from the 1/2 in. drain tube connected to the Model MRA-1 Manual Reset Actuator (N)
- That the Waterflow Pressure Switch (C) and its associated alarms properly operate
- That the Water Motor Alarm, if applicable, properly operates

**NOTE:** This procedure simulates automatic system operation upon both electric detection and loss of system air pressure.

**Internal Valve Inspection**

Once every five years during the annual operational test procedure and prior to the DV-5A Valve being reset and with the DV-5A Valve de-pressurized, the interior of the DV-5A Valve must be cleaned and inspected for wear and damage. Damaged or worn parts must be replaced. (Replacement of the Diaphragm every ten years is recommended, or more frequently if inspections and/or wear and tear warrant more frequent replacement.)

**NOTICE**

The Diaphragm Cover may be removed between Steps 4 and 5 of the resetting instructions, since at that point the DV-5A Valve should be de-pressurized as evident by a zero gauge reading on the Diaphragm Gauge (K) and Water Supply Gauge (J), as well as no water discharging from the Automatic Drain Valve (F).
To perform internal valve inspection between Steps 4 and 5 of the Valve Setting Procedure remove the Diaphragm cover as follows:

**Step 1.** Close the Inverted Flare Shut-Off Valve (R).

**Step 2.** Remove the Copper Tube Fitting between the Diaphragm Supply Valve (P) and the Inverted Flare Shut-Off Valve (R).

**Step 3.** Loosen the union securing the Electric/Electric Actuation Trim and remove the Electric/Electric Actuation Trim.

**Step 4.** Loosen and remove the union between the Diaphragm Cover and the MRA-1 Manual Reset Actuator (N) and remove the MRA-1 Manual Reset Actuator (N) subassembly.

**Step 5.** Remove the Diaphragm Valve Cover hardware, then slowly remove the Diaphragm Cover and perform internal valve inspection. Clean the valve interior and replace parts as necessary.

After cleaning and inspecting valve interior, and replacing parts as necessary, reinstall the Diaphragm Cover by completing the following steps to assure the Diaphragm Cover Fasteners are uniformly and securely tightened.

**Step 1.** With reference to Figure 1, ensure that the Diaphragm is properly oriented and that the proper hardware arrangement is utilized when assembling the Diaphragm Covers. The hardware arrangements differ depending on the size of the DV-5a Valve.

**Step 2.** By first using the Long Hex Bolts, support of the Diaphragm Cover will be provided before installing the Short Hex Bolts. Align Diaphragm in proper orientation with Valve Body, and then align Diaphragm Cover in proper orientation with Valve Body. Hand-tighten all fasteners.

**Step 3.** Using crossdraw sequence to assure uniformity, wrench-tighten Long Hex Bolts and Short Hex Bolts to appropriate torque values. Repeat crossdraw sequence two to three times at incremental torque valves until reaching the torque valves found in Table B.

**Step 4.** Inspect to assure all Hex Bolts are securely tightened.

**Step 5.** Using the union, secure the MRA-1 Manual Reset Actuator (N) to the Diaphragm Cover.

**Step 6.** Using the union, secure the Electric/Electric Actuation Trim.

**Step 7.** Replace the Copper Tube Fitting between the Diaphragm Supply Valve (P) and the Inverted Flare Shut-Off Valve (R).

**Step 8.** Ensure that the unions and flare fittings are securely tightened.

**Step 9.** With the Diaphragm Supply Valve (P) closed, fully open the Inverted Flare Shut-Off Valve (R) stainless steel screw (approximately 1/2 in.) until resistance is met so as not to break the internal roll-pin. The internal roll-pin stops the removal of the Inverted Flare Shut-Off Valve (R) stainless steel screw.

**Step 10.** Proceed with Step 5 of the Valve Setting Procedures section in this data sheet.

**NOTICE**

If the water supply contains chemicals which tend to attack a polyester fabric-reinforced, EPDM rubber or the five year inspection indicates a build-up of debris within the DV-5a Valve that could affect its proper operation, then the frequency of the internal valve inspection procedure must be appropriately increased.

With reference to Figure 1, make certain that the Diaphragm is correctly oriented; otherwise, the DV-5a Valve cannot be properly set.

Under-tightening the Diaphragm Cover Bolts can result in internal and external leakage.

Use only TYCO replacement fasteners as specified in Figure 1.

Do not apply adhesives, lubricants, or other substances to the Diaphragm Valve Body.
Limited Warranty

For warranty terms and conditions, visit www.tyco-fire.com.

Ordering Procedure

The TYCO DV-5a Automatic Water Control Valves may be ordered as follows:

**Pre-Assembled Valves with Trim**

DV-5a Valves with Galvanized Trim and Butterfly Valve

Specify: Size (specify), DV-5a Automatic Water Control Valve, G x G connections with assembled galvanized Americas Double Interlock Preaction with Electric/Electric Actuation Trim, complete with assembled Model BFV-300 Butterfly Valve, P/N (specify):

1 1/2 in. (DN40) 551011515
2 in. (DN50) 551011520
3 in. (DN80) 551011530
4 in. (DN100) 551011540
6 in. (DN150) 551011550
8 in. (DN200) 551011560

Notes:

Americas pressure switches, P/N 52-287-1-124 Solenoid Valve, and psi/kPa water pressure gauges are provided.

This arrangement is available for EMEA and APAC upon request. Contact your local distributor.

**AMERICAS**

DV-5a Valves with Galvanized Trim

Specify: Size (specify), DV-5a Automatic Water Control Valve, (specify) end connection with assembled galvanized Americas, Double Interlock Preaction Electric/Electric Actuation Trim, P/N (specify):

- Grooved x Grooved
  - 1 1/2 in. (DN40) 550101515
  - 2 in. (DN50) 550101520
  - 3 in. (DN80) 550101530
  - 4 in. (DN100) 550101540
  - 6 in. (DN150) 550101550
  - 8 in. (DN200) 550101560

- Flange x Flange ANSI
  - 3 in. (DN80) 550021530
  - 4 in. (DN100) 550021540
  - 6 in. (DN150) 550021550
  - 8 in. (DN200) 550021560

- Flange x Grooved ANSI
  - 3 in. (DN80) 550031530
  - 4 in. (DN100) 550031540
  - 6 in. (DN150) 550031550
  - 8 in. (DN200) 550031560

T x T NPT

1 1/2 in. (DN40) 550061515
2 in. (DN50) 550061520

**Note:** Pressure switches, P/N 52-287-1-124 solenoid valve, and psi/kPa water pressure gauges are provided.

**Separate DV-5a Valves without Trim**

See Table A for flange drilling specifications.

Specify: Size (specify), DV-5a Automatic Water Control Valve, (specify) end connection, P/N (specify):

- Groove x Groove
  - 1 1/2 in. (DN40) 530010015
  - 2 in. (DN50) 530010020
  - 3 in. (DN80) 530010030
  - 4 in. (DN100) 530010040
  - 6 in. (DN150) 530010060
  - 8 in. (DN200) 530010080

- Flange x Flange ANSI
  - 3 in. (DN80) 530020030
  - 4 in. (DN100) 530020040
  - 6 in. (DN150) 530020060
  - 8 in. (DN200) 530020080

- Flange x Groove ANSI
  - 3 in. (DN80) 530030030
  - 4 in. (DN100) 530030040
  - 6 in. (DN150) 530030060
  - 8 in. (DN200) 530030080

- T x T NPT
  - 1 1/2 in. (DN40) 530060015
  - 2 in. (DN50) 530060020

**Notes:** Valves are typically provided with flange drilling per ANSI B16.1 (Class 125) or ISO (7005-2 PN16). Upon request, valves can be provided with flange drilling per JIS B 2210 or AS 2129. In which case part numbers are not assigned.

**DV-5a Valve Trim**

Specify: Size (specify), finish (specify), Electric/Electric Actuation Trim for DV-5a Automatic Water Control Valves used in Double Interlock Preaction Fire Protection System, P/N (specify):

- Galvanized
  - 1 1/2 in. (DN40) 540001520
  - 2 in. (DN50) 540001520
  - 3 in. (DN80) 540001530
  - 4 in. (DN100) 540001540
  - 6 in. (DN150) 540001560
  - 8 in. (DN200) 540001580

- Black
  - 1 1/2 in. (DN40) 542001520
  - 2 in. (DN50) 542001520
  - 3 in. (DN80) 542001530
  - 4 in. (DN100) 542001540
  - 6 in. (DN150) 542001560
  - 8 in. (DN200) 542001580

**Note:** Pressure switches and/or solenoid valves for electric actuation are separately ordered.

**EMEA**

DV-5a Valves with Galvanized Trim

  - 2 in. (DN50) 530060020
Flange x Flange ISO
3 in. (DN80) .......................... 530040030
4 in. (DN100) .......................... 530040040
6 in. (DN150) .......................... 530040060
8 in. (DN200) .......................... 530040080

Flange x Groove ISO
3 in. (DN80) .......................... 530050030
4 in. (DN100) .......................... 530050040
6 in. (DN150) .......................... 530050060
8 in. (DN200) .......................... 530050080

T x T ISO
1 1/2 in. (DN40) .......................... 5300700015
2 in. (DN50) .......................... 530070020

Notes: Valves are typically provided with flange drilling per ANSI B16.1 (Class 125) or ISO (7005-2 PN16).

Upon request, valves can be provided with flange drilling per JIS B 2210 or AS 2129. In which case part numbers are not assigned.

DV-5a Valve Trim
Specify: Size (specify), finish (specify), Double Interlock Preaction Electric/Electric Actuation Trim for DV-5a Automatic Water Control Valves used in Deluge Fire Protection System, P/N (specify):

Galvanized
1 1/2 in. (DN40) .......................... 540101520
2 in. (DN50) .......................... 540101520
3 in. (DN80) .......................... 540101530
4 in. (DN100) .......................... 540101540
6 in. (DN150) .......................... 540101560
8 in. (DN200) .......................... 540101580

Black
1 1/2 in. (DN40) .......................... 542101520
2 in. (DN50) .......................... 542101520
3 in. (DN80) .......................... 542101530
4 in. (DN100) .......................... 542101540
6 in. (DN150) .......................... 542101560
8 in. (DN200) .......................... 542101580

Note: Pressure switches, solenoid valves for electric actuation, water pressure gauges, and BFV-300 Butterfly Valve are separately ordered. NPT to ISO threaded adapters are provided for External Trim Connections (drains, pressure switches, water motor alarms, etc.).

APAC

DV-5a Valves with Galvanized Trim
Specify: Size (specify), DV-5a Automatic Water Control Valve, (specify) end connection with assembled galvanized APAC, Double Interlock Preaction Electric/Electric Actuation Trim, P/N (specify):

Grooved x Grooved
1 1/2 in. (DN40) .......................... 550011515
2 in. (DN50) .......................... 550011520
3 in. (DN80) .......................... 550011530
4 in. (DN100) .......................... 550011540
6 in. (DN150) .......................... 550011560
8 in. (DN200) .......................... 550011580

Flange x Flange ANSI
3 in. (DN80) .......................... 550021530
4 in. (DN100) .......................... 550021540
6 in. (DN150) .......................... 550021560
8 in. (DN200) .......................... 550021580

Notes: Valves are typically provided with flange drilling per ANSI B16.1 (Class 125) or ISO (7005-2 PN16).

Upon request, valves can be provided with flange drilling per JIS B 2210 or AS 2129. In which case part numbers are not assigned.

DV-5a Valve Trim
Specify: Size (specify), finish (specify), Double Interlock Preaction Electric/Electric Actuation Trim for DV-5a Automatic Water Control Valves used in Deluge Fire Protection System, P/N (specify):

Galvanized
1 1/2 in. (DN40) .......................... 540001520
2 in. (DN50) .......................... 540001520
3 in. (DN80) .......................... 540001530

DV-5a Valve Trim Accessories (for separately ordered valve trim)
Specify: (Specify Accessory Description), P/N (specify):

Model QRS
Quick Release Switch Q1 .......................... Refer to Technical Data Sheet TFP1100
Waterflow Pressure Alarm Switch, Potter PS10-2 (America/APAC) .......................... 25720
Waterflow Pressure Alarm Switch PS10-1 (EMEA) .......................... 0260
Model WMA-1 Water Motor Alarm (America/APAC) .......................... 526301001P
Model WMA-1 Water Motor Alarm (EMEA) .......................... 526301021R
Model AMD-1 Air Maintenance Device .......................... 523242002
Model AMD-3 Nitrogen Maintenance Device .......................... 523282001
Model MC-1 Manual Control Stations, .......................... 522892001
Water Gauges with bar/psi, .......................... 025500013
600 psi Water Gauge psi/kPa (service pressure over 300 psi) .......................... 923431004
Solenoid Valve for Releasing Service .......................... Refer to Technical Data Sheet TFP2108

DV-5a Valve Replacement Parts
Specify: (Description) for use with (specify size) DV-5a Automatic Water Control Valve, P/N (See Figure 1)

DV-5a Valve Trim Replacement Parts
Specify: (Description) for use with DV-5a Valve Trim, P/N (See Figure 6)
